

GitScout

GitHub Talent Intelligence Platform

```
fetch("verified developer signals").score()
```

Hiring technical talent is slow, expensive, and opaque.

76%

of companies face a tech talent shortage.

Qubit Labs, 2024

5.4 mo

average time to hire a software engineer.

Linux Foundation

\$50K+

fully-loaded cost per developer hired.

Devskiller

\$162B

in US revenue estimated lost to the talent gap.

Korn Ferry

GitHub is the world's largest verifiable developer signal.

150M+

developers worldwide

420M+

public repositories

83%

hiring managers trust GitHub over resumes

Stars signal impact

Developers with 10+ starred repos receive 4x more interview invites.

Commits signal staying power

Active contributors (3+ commits/week) show 68% higher retention.

PRs signal quality

Merged PRs in 3+ repos correlate with 40% better performance reviews.

What GitScout does.

Four surfaces that turn GitHub activity into hiring decisions.

01

Advanced Search

Filter 150M+ developers by language, location, followers, repo count. Results are re-ranked live by GitScout relevance score.

02

Profile Analytics

Aggregated view of repos, stars, languages, and 90-day activity — pulled from the GitHub REST API behind a 5-minute cache.

03

Talent Scoring

Transparent 0–100 score with four weighted components: popularity, activity, language breadth, and community reach.

04

Shortlists & Export

Save, organize, and compare candidates in persistent SQLite-backed lists. One-click CSV export for ATS handoff.

GitScout Score

A transparent weighted sum — no black box, no magic.

MAXWEIGHTSIGNAL

35	pts	Popularity total repository stars
30	pts	Activity recent public events
20	pts	Breadth languages + repos
15	pts	Reach community followers
100	pts	Total score

// example

@torvalds

popularity		35/35
activity		30/30
breadth		9/20
reach		15/15

Total89 / 100

Search → Profile → Shortlist → Export.

The full recruiter loop ships end-to-end.

Small stack. Typed all the way down.

STACK

A validated market, a sharper lens.

Juicebox raised \$36M from Sequoia on this thesis. We differentiate on transparency and focus.

COMPANY	FUNDING	FOCUS
Juicebox	\$36M Series A	AI multi-source search
Serra	YC-backed	Automated outreach
Git-Talents	Bootstrapped	Email extraction
GitHunt	Early stage	Pay-per-search

How GitScout differs

Transparent

Scoring is a weighted sum. Every input is visible in the UI.

Focused

Built for small-to-mid teams, not enterprise bloat.

Open

Modern open stack — Bun, Elysia, Next.js — no proprietary lock-in.

Honest

Only public signals. No PII exfiltration, no scraped emails.

Shipped. Tested. Live.

Nine pull requests merged. 12 server tests passing. End-to-end flow runs against the live GitHub API.

WHAT WORKS END - TO - END

- ✓ Search with language / location / follower filters
- ✓ Shortlist CRUD with live add/remove via dropdown
- ✓ Swagger docs, health checks, rate-limit badge
- ✓ Candidate profiles with score breakdown
- ✓ CSV export with proper escaping + timestamped filename
- ✓ Unauthenticated OR token-authenticated GitHub access

What the MVP unlocks.

A working foundation to layer recruiter-facing intelligence on top.

- | | | |
|---|------------------------------------|--|
| → | Personalized outreach | Generate contribution-specific messages with 5× higher response rates. |
| → | Role-fit matching | AI ranking against a job description, not a free-text query. |
| → | LinkedIn + email enrichment | Merge GitHub signal with adjacent professional context. |
| → | Team analytics | Track shortlist funnel metrics, scoring drift, and reviewer agreement. |

Thanks.
